FP8 is non-inferior to BF16 within a 1-point margin in all 8 tests

Each row is one benchmark at one training context length (L = tokens). A dot right of 0 means the FP8 model scored lower.
The test uses the blue 95% interval (one-sided alpha 0.025; its upper end is printed on the right). It must stay left of the red 1-point line.
All 8 do, so the verdict fixed before the run is NONINFERIOR. Gray = stricter bound for testing 8 cells at once, shown for context.
Covers these 4 benchmarks, scored with plain BF16 inference, from one training run per model (seed 23): test-set noise only.
