FP8 cuts the persistent layer-input store in CPU RAM by 45%

Layer-by-layer training keeps each layer's input in CPU RAM until the backward pass (one optimizer step = 4096 tokens).
In FP8 this store takes 237 MiB instead of 432 MiB (-45%), counting the routing record Oracle keeps. Same size at 1024 and 4096 tokens.
Total activation memory was not measured. GPU peaks are unchanged; sampled peak process RAM drops 5% (4096 tokens only).
